This card dispenser comprises a case consisting of a container (3) intended to receive the said cards in the form of a stack (13), and a cover (2) reversibly attached to the container (3) and defining with the latter at one of its ends a slot (5) capable of allowing the extraction of a card from the said case. The cover (2) is provided with a pin (6) which is integral with a member (10) having an elastic memory effect, whose end (11) is provided with an end-piece (12) having a high coefficient of friction and whose action is directed downwards and in particular towards the stack (13) and is in contact with the latter, the said pin (6) being capable of being moved under the action of the user in the direction perpendicular to the slot in order to induce the output of cards one-by-one.
